WO 02/36562 A2

1-ARYL- OR 1-ALKYLSULFONYL-HETEROCYCLYLBENZAZOLES AS
5-HYDROXYTRYPTAMINE-6 LIGANDS

5 This invention relates to 1-Aryl- or 1-alkylsulfonyl-heterocyclylbenzazoles useful as 5-hydroxytryptamine-6 ligands, to processes for preparing them, to pharmaceutical compositions containing them and to methods of treatment using them.

10

BACKGROUND OF THE INVENTION

Compounds capable of forming 5-HT6 receptor ligands are potentially useful in the treatment of a number of
15 central nervous system disorders such as anxiety, depression, epilepsy obsessive compulsive disorders, migraine, cognitive disorders, sleep disorders, feeding disorders, panic attacks, disorders resulting from withdrawal from drug abuse, schizophrenia, or certain
20 gastrointestinal disorders such as irritable bowel syndrome. Significant efforts are being made to understand the recently identified 5HT-6 receptor and its possible role in neuropsychiatric and neurodegenerative functions. To that end, new compounds which demonstrate
25 a binding affinity for the 5HT-6 receptor are earnestly sought, particularly as potential potent therapeutic agents.

Therefore, it is an object of this invention to provide compounds which are useful as therapeutic agents
30 in the treatment of a variety of conditions related to or affected by the 5-HT6 receptor.

It is another object of this invention to provide methods and compositions useful for the treatment of psychoses (e.g., schizophrenia, anxiety, or depression),

motor disorders (e.g., Parkinson's disease), anxiety, depression, obsessive compulsive disorder, attention deficit disorder, or any condition which is known to be related to or affected by the 5-HT₆ receptor.

5 These and other objects and features of this invention will become more apparent by the detailed description set forth hereinbelow.

DETAILED DESCRIPTION OF THE INVENTION

The 5-hydroxytryptamine-6 (5-HT₆) receptor is one of
the most recent receptors to be identified by molecular
25 cloning. Its ability to bind a wide range of therapeutic
compounds used in psychiatry, coupled with its intriguing
distribution in the brain has stimulated significant
interest in new compounds which are capable of
interacting with or affecting said receptor. At present,
30 there are no known fully selective agonists. Significant
efforts are being made to understand the possible role of

the 5-HT₆ receptor in psychiatry, cognitive dysfunction, motor function and control, memory, mood and the like. To that end, compounds which demonstrate a binding affinity for the 5-HT₆ receptor are earnestly sought both
 5 as an aid in the study of the 5-HT₆ receptor and as potential therapeutic agents in the treatment of central nervous system disorders.

Surprisingly, it has now been found that 1-alkyl- or 1-arylsulfonyl-heterocyclylbenzazoles of formula I
 10 demonstrate 5-HT₆ affinity along with significant sub-type selectivity. Advantageously, said formula I benzazoles are effective therapeutic agents for the treatment of central nervous system disorders associated with or affected by the 5-HT₆ receptor. Accordingly, the
 15 present invention provides 1-alkyl- or 1-arylsulfonyl-heterocyclylbenzazole compounds of formula I

 25 group, with a sulfonylating agent containing the group:

wherein R_8 is as defined above, and if required removing the protecting group G to give a compound of
 5 Formula I wherein R_1 is hydrogen;

or

ii) reacting a compound of formula

wherein the dotted line, n , m , R_1 , R_2 , R_3 , R_4 , R_5 , R_6 ,
 10 R_9 , X , Y and A are as defined above, with a sulphonylating agent containing the group

 15 formula (I);

iii) reacting a compound of formula I wherein R_1 is
 20 hydrogen with a compound of formula:

wherein R_1 is as defined above (excepting hydrogen) and L is a suitable leaving group, e.g. halogen or SMe to give a corresponding compound of formula I;

or

- iv) alkylating a compound of formula (I) wherein A is CR_{10} in which R_{10} is OH with an alkylating agent containing the group R_a where R_a is optionally substituted alkyl to give a compound of formula (I) wherein R_{10} is optionally substituted alkoxy;

5

Methods for converting reactive substituent groups in compounds of formula I to other substituent groups are well known to those skilled in the art. For example benzyl groups may be removed and replaced by hydrogen. Acetylamino groups may be converted to amino groups by hydrolysis.

10

In any of the reactions described herein reactive substituent groups or sites in the molecule may be protected prior to reaction by use of appropriate protecting groups inert to the reaction conditions and removing said protecting groups after the reaction .

15

In detail compounds of the invention may be prepared using conventional synthetic methods and, if required, standard separation and isolation techniques. For example, 4-(piperazin-1-yl)indole compounds of formula II may be readily prepared by the catalytic hydrogenation of the 4-nitroindole precursor of formula III to the corresponding 4-aminoindole of formula IV and reacting said formula IV indole with a bis-alkylating agent such as bis(2-chloroethyl)amine to give the desired formula II intermediate. The reaction is illustrated in flow diagram I.

20

25

30

FLOW DIAGRAM I

- 5 The formula II intermediate may then be converted to a compound of formula I wherein A is N, m is 2; R_1 is H; R_2 , R_3 , and R_4 are H; --- represents a single bond; and the heterocyclyl group is in the 4-position, by reacting the formula II intermediate with a protecting group, G,
- 10 for example di-*t*-butyl dicarbonate, to selectively protect the piperazine basic N atom to give the compound of formula V and sequentially reacting said formula V compound with a base such as NaH and a sulfonyl chloride, $R_8\text{SO}_2\text{Cl}$ to give the protected 4-(piperazin-1-yl)-1-
- 15 (substituted-sulfonyl)indole and deprotecting said indole to give the desired compound of formula Ia. Reaction of said formula Ia compound with a reagent $R_1\text{-Hal}$, wherein R_1 is defined hereinabove for formula I and Hal is Cl, Br or I in the presence of a base gives compounds of formula Ib
- 20 wherein R_1 is other than H. The reaction sequence is shown in flow diagram II.

FLOW DIAGRAM II

5

Corresponding compounds of the invention wherein A is CR₁₀ may be obtained, for example, by lithiating a protected 4-bromoindole of formula VI wherein G is benzyl, and displacing the lithium group with a cyclic ketone such as an N-protected-4-piperidone to give the hydroxy intermediate of formula VII, which may then be dehydrated and sulfonylated in the manner described hereinabove to give the protected compound of formula VIII. Catalytic hydrogenation and simultaneous deprotection of said formula VIII compound gives the desired compounds of formula I wherein ---- represents a single bond (formula Id). The reaction sequence is shown in flow diagram III.

enables the construction of the corresponding compounds
of formula I wherein the heterocyclyl group is in the 5-,
6-, or 7-position and X or Y is N.

The mixture is stirred at room temperature overnight, the acetone evaporated and the remaining aqueous phase extracted with ethyl acetate. The extracts are dried over MgSO_4 and concentrated *in vacuo* to give a residue. The residue is purified by flash chromatography to give 4-(1H-indol-5-yl)-piperazine-1-carboxylic acid *tert*-butyl ester.

A solution of said ester (60 mg, 0.2 mmol) in tetrahydrofuran is treated with sodium hydride (30 mg,

0.5 mmol) followed by N-acetylsulfanilyl chloride (25 uL, 0.2 mmol), shaken at room temperature for 16 hours and concentrated *in vacuo* to give 4-[1-(4-acetylamino-phenylsulfonyl)-1H-indol-5-yl]-piperazine-1-carboxylic acid *tert*-butyl ester.

The thus-obtained ester is dissolved in methanol, treated with concentrated hydrochloric acid (100 uL), shaken at 60°C for 2 hours and concentrated *in vacuo* to give a residue. The residue is purified by HPLC to give the title product, 15 mg, identified by HPLC and mass spectral analyses (r.t. 2.37 min., M+H 357).

EXAMPLE 103Comparative Evaluation of 5-HT6 Binding Affinity of Test Compounds

5

The affinity of test compounds for the serotonin 5-HT6 receptor is evaluated in the following manner. Cultured Hela cells expressing human cloned 5-HT6 receptors are harvested and centrifuged at low speed
10 (1,000 x g) for 10.0 min to remove the culture media. The harvested cells are suspended in half volume of fresh physiological phosphate buffered saline solution and recentrifuged at the same speed. This operation is repeated. The collected cells are then homogenized in ten
15 volumes of 50 mM Tris.HCl (pH 7.4) and 0.5 mM EDTA. The homogenate is centrifuged at 40,000 x g for 30.0 min and the precipitate is collected. The obtained pellet is resuspended in 10 volumes of Tris.HCl buffer and recentrifuged at the same speed. The final pellet is
20 suspended in a small volume of Tris.HCl buffer and the tissue protein content is determined in aliquots of 10-25 μ l volumes. Bovine Serum Albumin is used as the standard in the protein determination according to the method described in Lowry et al., J. Biol. Chem., 193:265
25 (1951). The volume of the suspended cell membranes is adjusted to give a tissue protein concentration of 1.0 mg/ml of suspension. The prepared membrane suspension (10 times concentrated) is aliquoted in 1.0 ml volumes and stored at -70° C until used in subsequent binding
30 experiments.

Binding experiments are performed in a 96 well microtiter plate format, in a total volume of 200 μ l. To

each well is added the following mixture: 80.0 μ l of incubation buffer made in 50 mM Tris.HCl buffer (pH 7.4) containing 10.0 mM $MgCl_2$ and 0.5 mM EDTA and 20 μ l of [3H]-LSD (S.A., 86.0 Ci/mmol, available from Amersham Life Science), 3.0 nM. The dissociation constant, K_D of the [3H]LSD at the human serotonin 5-HT₆ receptor is 2.9 nM, as determined by saturation binding with increasing concentrations of [3H]LSD. The reaction is initiated by the final addition of 100.0 μ l of tissue suspension.

10 Nonspecific binding is measured in the presence of 10.0 μ M methiothepin. The test compounds are added in 20.0 μ l volume.

The reaction is allowed to proceed in the dark for 120 min at room temperature, at which time, the bound ligand-receptor complex is filtered off on a 96 well unifilter with a Packard Filtermate[®] 196 Harvester. The bound complex caught on the filter disk is allowed to air dry and the radioactivity is measured in a Packard TopCount[®] equipped with six photomultiplier detectors,

15 after the addition of 40.0 μ l Microscint[®]-20 scintillant to each shallow well. The unfilter plate is heat-sealed and counted in a Packard TopCount[®] with a tritium efficiency of 31.0%.

Specific binding to the 5-HT₆ receptor is defined as the total radioactivity bound less the amount bound in the presence of 10.0 μ M unlabeled methiothepin. Binding in the presence of varying concentrations of test compound is expressed as a percentage of specific binding in the absence of test compound. The results are plotted as log % bound versus log concentration of test compound.

25 Nonlinear regression analysis of data points with a computer assisted program Prism[®] yielded both the IC₅₀ and

30

the K_i values of test compounds with 95% confidence limits. A linear regression line of data points is plotted, from which the IC_{50} value is determined and the K_i value is determined based upon the following equation:

$$K_i = IC_{50} / (1 + L/K_D)$$

where L is the concentration of the radioactive ligand used and K_D is the dissociation constant of the ligand for the receptor, both expressed in nM.

Using this assay, the following K_i values are determined and compared to those values obtained by representative compounds known to demonstrate binding to the 5-HT₆ receptor. The data are shown in Table VI, below.

<u>Comparative Examples</u>	<u>5-HT₆ binding K_i</u>

Loxapine	41.4
Bromocriptine	23.0
Methiothepin	8.3
Mianserin	44.2

As can be seen from the results set forth above, the compounds of the present invention have a high degree of affinity for the serotonin 5-HT₆ receptor sub-type.

- 5 Although two of the comparison compounds (clozapine and methiothepin) have similar 5-HT₆ receptor affinity, they do not have the selectivity of the compounds of the present invention. The examples disclosed above demonstrate up to 50-fold selectivity for the 5-HT₆

receptor when compared to their affinity at the 5-HT₇ receptor.
